INTRODUCTION

Contact Lens Papillary Conjunctivitis (CLPC), is one of the main reasons for discontinuations from contact lens (CL) wear¹. Signs and symptoms of CLPC:

Papillae, tarsal conjunctival hyperemia, excessive Signs: lens movement, decentration and deposits.

Symptoms: Itchiness, grittiness, mucus discharge, discomfort, blurred vision.

Recently we observed that CLPC presented as:

a) Localised, where papillae and hyperemia are seen localised on the tarsus close to the lid margin and

b) Generalised, where the entire tarsus exhibits papillae².

Generalised CLPC is the more familiar condition, most commonly seen in low Dk CL wear.

To date no data has been published on the incidence of CLPC with extended wear (EW) of high Dk soft CL.

PURPOSE

To determine the incidence of CLPC with high Dk soft CLs used on a 6N or 30N EW schedule and to determine the prevalence of generalised versus localised CLPC.

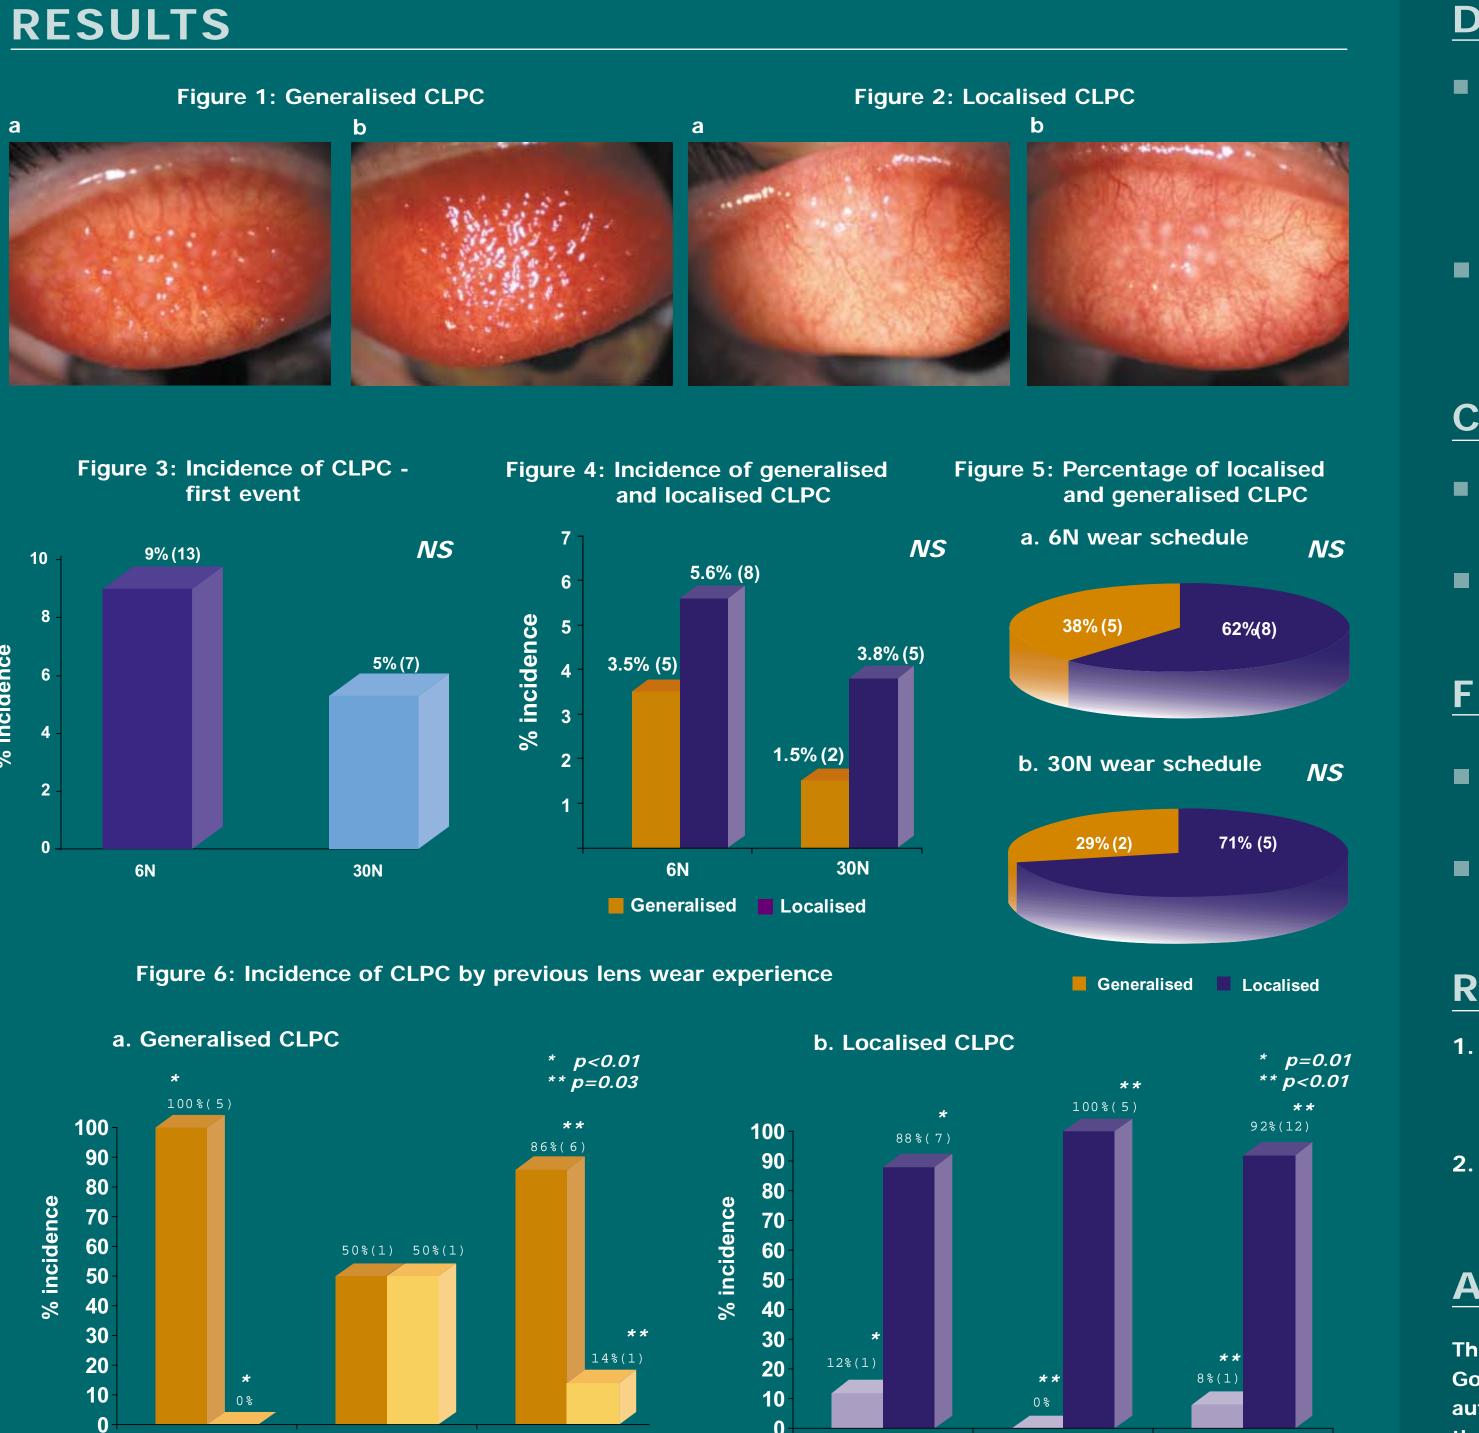

METHODS AND MATERIALS

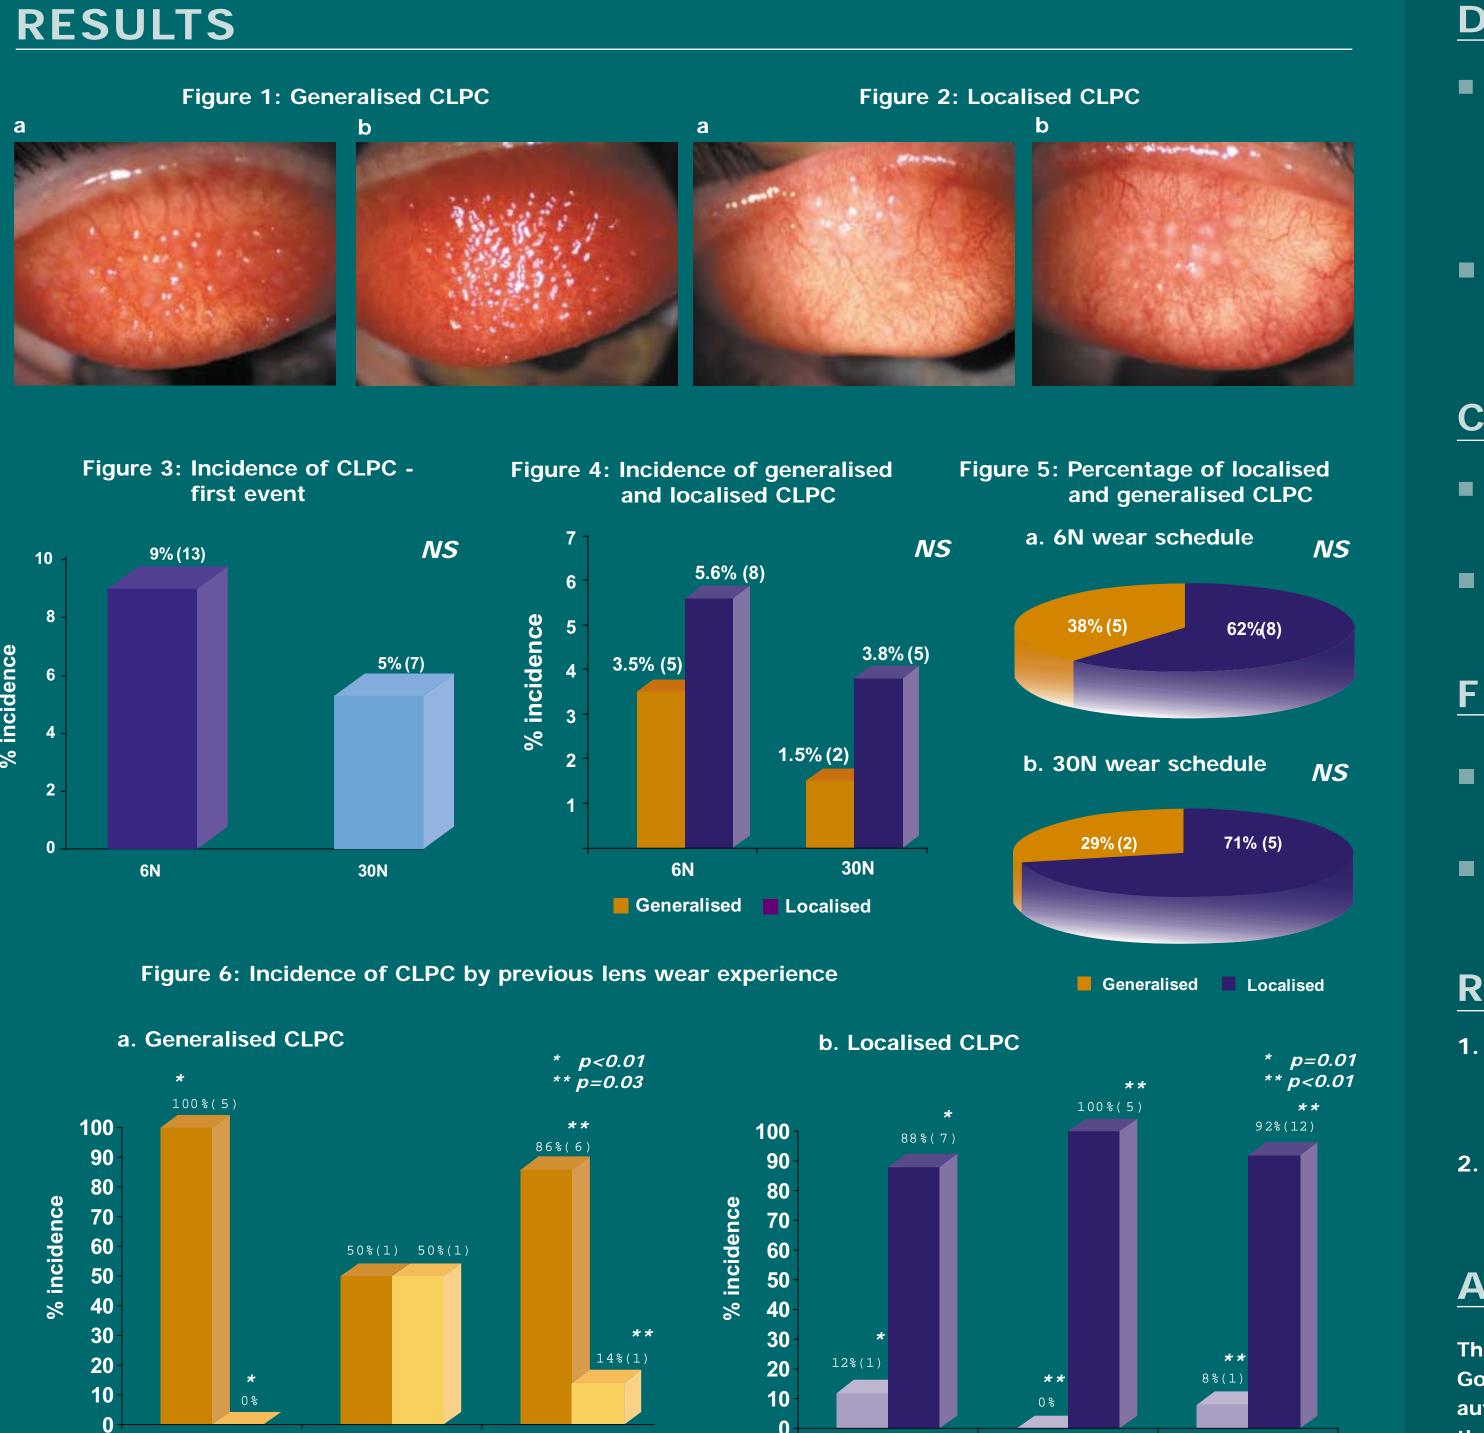

Prospective 24 month clinical trial

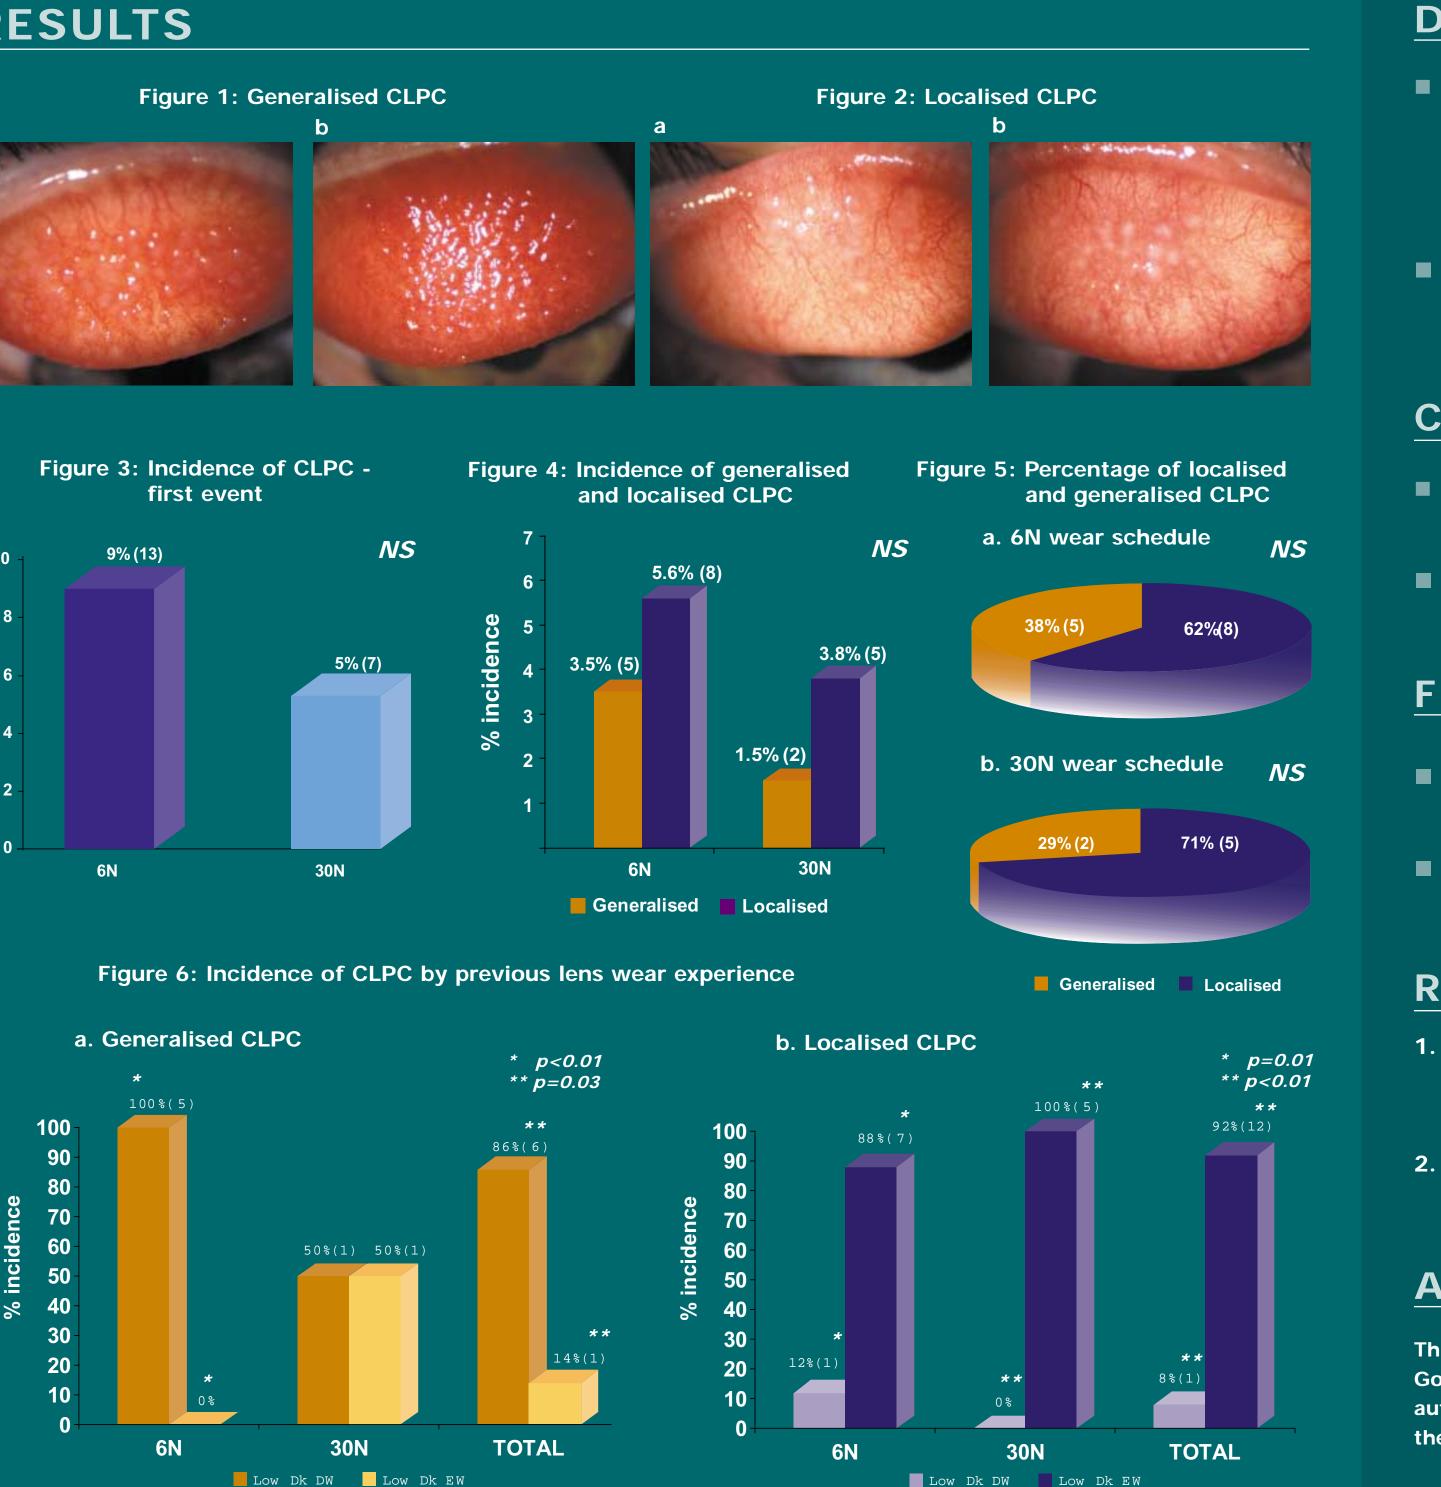

93 subjects

DEMOGRAPHICS	6N (45)	30N (48)
Previous lens wear experience	Low Dk EW (6N) (24) Low Dk DW (21)	Low Dk EW (6N) (25) Low Dk DW (23)
Wear and replacement schedule	6N EW followed by overnight removal; 30N disposal	30N wear 30N disposal
Mean Rx Sphere (D) Cyl (D)	-3.05±1.25 -0.41±0.37	-2.97±1.34 -0.26±0.30
Sex M:F	15:30	25:23
Age (mean±SD,yrs)	31±8	31±7

- Randomly assigned bilateral prototype high Dk soft CL (Lotrafilcon A, 24% H_2O_1 , 175 Dk/t -3.00D).
- Subjects were reviewed at 1 week, 1 and 3 months EW then 3 monthly intervals until 24 months.
- At diagnosis CLPC was categorised as: Generalised: papillae scattered over the tarsus Localised: papillae predominantly in specific areas of the tarsus.
- Incidence of CLPC reported as number of first events per one hundred eyes.
- Differences between the two groups (6N and 30N) assessed using Student's t-tests.

CRCERT

DISCUSSION

■ No difference in the incidence of CLPC between the wear schedules, therefore, removing and cleaning the lenses once a week seems to have no effect on the development of CLPC. This may change if the 6N group replaced the lenses after 6N EW.

There was a higher incidence of localised CLPC for the group that had previous low Dk EW experience. This EW experience or length of lens wear may have sensitised the tarsus to develop localised CLPC.

CONCLUSION

There is no difference in the incidence of CLPC between the 6N and 30N schedules.

■ There is no difference in the prevalence of localised or generalised CLPC with the EW of high Dk soft CLs.

FUTURE STUDIES

■ To compare the incidence of CLPC of subjects with no CL experience to experienced CL wearers.

■ To determine the incidence of CLPC on a 6N replacement schedule compared to a 30N replacement schedule.
